

Advising the Congress on Medicare issues

Beneficiary and physician focus groups

Christine Aguiar and Joan Sokolovsky
September 11, 2014

Presentation overview

- Evolution of the focus groups
- Historical findings on access to care
- Emerging themes on access to care
- Primary care provider perspectives on access to care and organization of care
- Beneficiary and near-beneficiary approaches to plan choice

Evolution of the focus groups

- Annual focus groups have three parts:
 - Beneficiary focus groups
 - Physician focus groups
 - Site visits
- Evolved from a 2006 project on implementation of Part D
- Commission found that the beneficiary focus groups:
 - Informed which aspects of survey results were unreliable
 - Added depth of understanding to beneficiaries' decision process
 - Revealed emerging trends among beneficiaries and providers

Evolution of the focus groups

- Physician focus groups were added to capture emerging issues, such as concierge medicine
- Site visits were added to give context of local market dynamics and to capture additional perspectives on issues raised during the focus groups

Historical findings on beneficiary access

- In general, beneficiaries:
 - Have a regular source of primary care
 - Do not report difficulty accessing prescription drugs
 - Have difficulty accessing certain specialists

Emerging themes on access to care

- New findings from this round of focus groups:
 - Urgent care centers: More beneficiaries than previous years reported using urgent care centers as substitutes for primary care
 - Nurse practitioners: Beneficiaries said nurse practitioners improve their access to timely primary care. Beneficiaries generally had positive opinions of nurse practitioners
 - Medicare Advantage networks: A few beneficiaries had to find new providers due to Medicare Advantage network changes

Primary care provider perspectives on beneficiaries' access to care

- Majority of providers (physicians and nurse practitioners) in the focus groups accept Medicare
- Providers reported difficulty securing referrals to dermatologists and psychiatrists
- Providers said they are increasingly – and sometimes reluctantly – treating beneficiaries' behavioral health conditions in primary care settings

Organization of care: medical homes

- Primary care physicians had mixed reactions to medical homes
- Most said that the cost of being certified and sustaining the model precludes solo or small group practices from participating
- Beneficiaries in our focus groups were unfamiliar with the term “medical home”

Organization of care: hospital employment of physicians

Pros of employment

- Eliminates financial stress of running a practice
- Availability of additional staff support and ancillary services
- Security of receiving a salary
- Not being responsible for all hospital rounds
- Knowing patients will be seen, even if by another practitioner
- Support from colleagues when deciding how to treat a patient

Cons of employment

- Loss of independence and autonomy
- Pressure to refer within the health system
- Pressure to meet financial and quality targets
- Risk the health system will fire the physician
- Cannot implement changes or new ideas rapidly
- Loss of control over salaries of office staff

Approaches to plan choice: understanding Medicare

- Beneficiaries and generally view Medicare as complex
- In particular, there was confusion regarding:
 - Differences between a supplemental plan and a Medicare Advantage plan
 - Part B and Part D late enrollment penalties

Approaches to plan choice: sources of information

- Health plans were beneficiaries' most common source of information on Medicare
- Most beneficiaries do not rely on the Medicare website or handbook, but near-beneficiaries said they were likely to use these resources
- Beneficiaries and near-beneficiaries said the website and handbook should be simplified and summarized

Approaches to plan choice: decision factors

Beneficiaries

- Out-of-pocket costs
 - Access to current physicians
 - Provider network
 - Covered benefits
 - Travel
 - Simplicity
-

Near-beneficiaries

- Out-of-pocket costs
- Access to current physicians
- Provider network
- Covered benefits
