

*Advising the Congress on Medicare issues*

# Assessing payment adequacy and updating payments: Inpatient rehabilitation facility services

Dana Kelley

December 11, 2015

# Inpatient rehabilitation facilities

---

- Provide intensive rehabilitation
- Medicare spending: \$7.0 billion in 2014
  - Facilities = 1,180
  - Cases = 375,000
  - Mean payment per case = \$18,600
- Per case payments vary by condition, level of impairment, age, and comorbidity; adjusted for:
  - Rural location, teaching status, low-income share, short stays
  - Outlier payments for extraordinarily costly patients

# IRF criteria

---

- IRFs must
  - Meet the conditions of participation for acute-care hospitals
  - Have a medical director of rehabilitation
  - Meet the compliance threshold (60 percent rule)
    - Volume and patient mix sensitive to policy changes
- Patients must
  - Tolerate and benefit from 3 hours of therapy per day
  - Require at least two types of therapy

# Payment adequacy framework

---

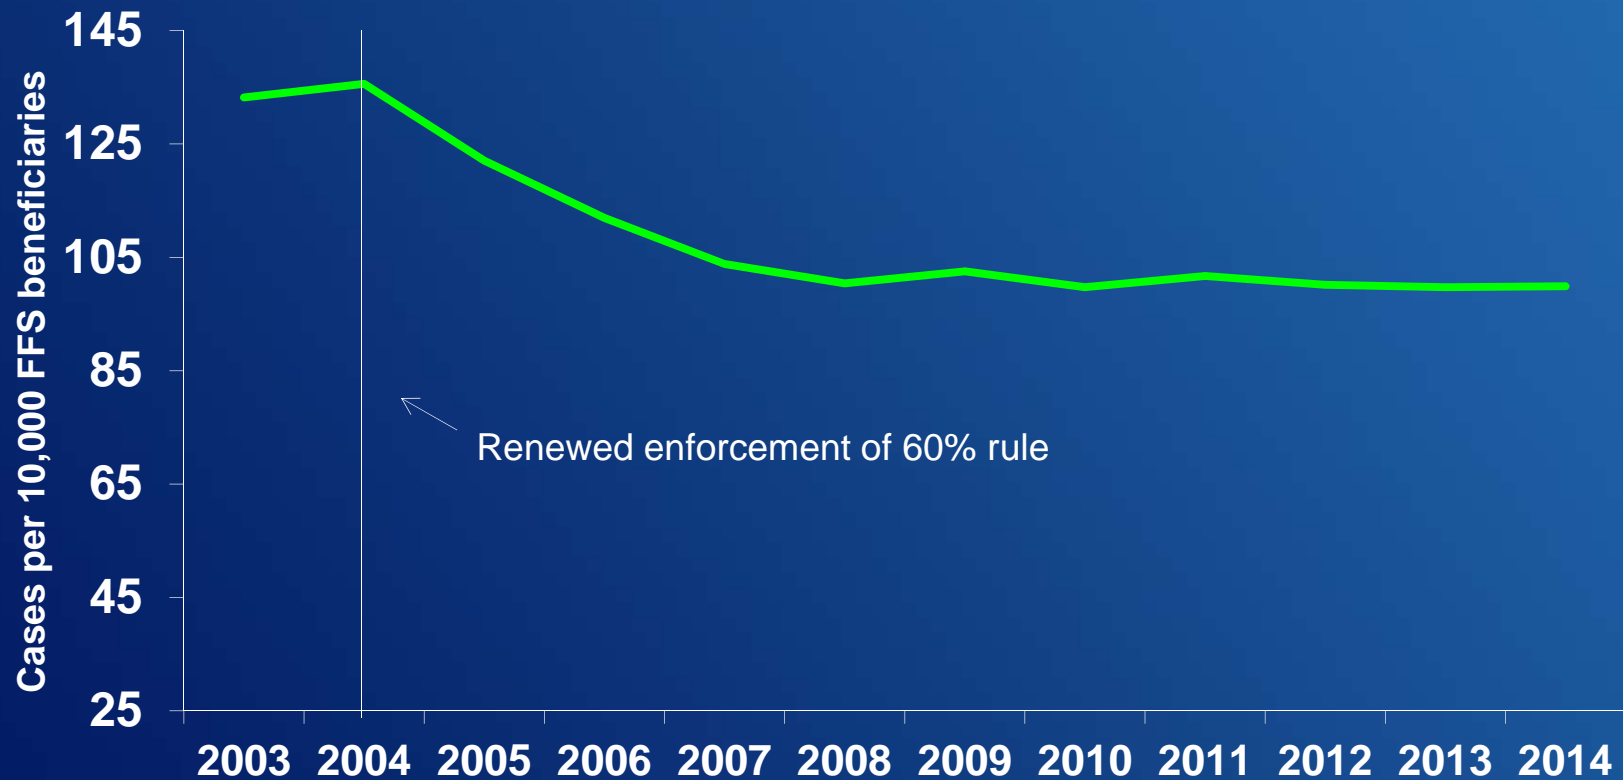

- Access
  - Supply of providers
  - Volume of services
- Quality
- Access to capital
- Payments and costs

# IRF supply remained fairly steady in 2014; share of for-profits continued to increase

	Facilities	Cases	Average annual change in number of facilities	
			2006-2013	2013-2014
All IRFs	1,180	375,000	-0.9%	1.4%
Freestanding	21%	48%	1.9%	3.3%
Hospital-based	79%	52%	-1.5%	0.9%
Nonprofit	58%	43%	-1.9%	0.6%
For-profit	29%	50%	1.2%	5.0%
Government	13%	7%	-1.3%	-3.9%

➤ Average occupancy rate: 64%

# On a FFS basis, steady volume of IRF cases since 2008

# Quality measures remained stable

<u>Risk-adjusted measure</u>	<u>2013</u>	<u>2014</u>
Gain in motor function	23.1	23.5
Gain in cognitive function	3.8	3.9
Discharged to community	75.7%	76.1%
Discharged to SNF	6.8%	6.9%
Potentially avoidable rehospitalizations		
During IRF stay	2.5%	2.5%
Within 30 days after discharge from IRF	4.5%	4.5%

# Access to capital appears adequate

---

- Hospital-based units
  - Access capital through their parent institutions; hospitals maintain strong access to capital markets
- Freestanding facilities
  - Based on one major chain, access to capital appears very good; acquisitions and construction reflect positive financial health
  - Little information available for others

# IRF Medicare margins, 2014

	% of IRFs	% of cases	Margin
All IRFs	100%	100%	12.5%
Freestanding	21%	48%	25.3%
Hospital-based	79%	52%	1.0%
Nonprofit	58%	43%	2.1%
For-profit	29%	50%	24.3%

➤ Marginal profit: 30.4%

Government-owned IRFs are not shown but are reflected in the aggregate margin. Results are preliminary and subject to change.

# Factors that affect the margins of hospital-based IRFs

---

- Higher routine, ancillary & indirect costs than freestanding IRFs
    - Hospital-based IRFs' routine costs were 70% higher
  - Majority are nonprofit and may be less focused on cost control
  - Tend to be smaller with lower occupancy
    - 66% have fewer than 25 beds
- Marginal profit for hospital-based IRFs = 19%

Results are preliminary and subject to change.  
Source: MedPAC analysis of Medicare cost report and claims data from CMS.

# Summary

---

- Access: Capacity appears adequate to meet demand
- Quality: Risk-adjusted outcome measures are stable
- Access to capital: Appears adequate
- 2014 estimated margin: 12.5%
- 2014 estimated marginal profit: 30.4%

# Concerns about IRF PPS

---

- Aggregate margin is high and projected to increase
  - Should payments be rebased?
- Wide variation in margins
  - Low-margin IRFs may be less efficient
  - High-margin IRFs: Could patient selection and coding be a factor?

# IRF patient mix differs by margin group

“Neurological disorders” include multiple sclerosis, Parkinson's disease, ALS, and polyneuropathy. Only IRF cases with an acute-care hospital stay within 30 days of admission to the IRF were included in the analysis. IRFs were ranked by their 2013 Medicare margins and then sorted into 5 equal-sized groups. Results are preliminary and subject to change.

Source: MedPAC analysis of FY2013 MedPAR, IRF-PAI data, and cost report data from CMS.

# Characteristics of patients in high-margin IRFs

---

- Appear to be *less* severely ill during preceding ACH stay
  - Lower ACH case mix
  - Less likely to spend time in ICU/CCU
  - Less likely to be high-cost outliers in ACH
- Appear to be *more* impaired during IRF stay
  - Lower motor and cognition scores
  - More likely to be coded with comorbidities that increase payment
- At any level of ACH severity, high-margin IRFs consistently code higher impairment

# Average IRF motor score at admission by type of stroke, for IRFs with the lowest and highest margins

Type of stroke	Motor score	
	Quintile 1 (Lowest margin)	Quintile 5 (Highest margin)
Left body involvement	28.6	24.4
Right body involvement	29.7	24.9
No paralysis	35.3	29.0

- Stroke cases with no paralysis 2x more common in IRFs with the highest-margins

Lower motor scores indicate greater impairment. Only IRF cases with an acute-care hospital stay within 30 days of admission to the IRF were included in the analysis. IRFs were ranked by their 2013 Medicare margins and then sorted into 5 equal-sized groups (quintiles). Results are preliminary and subject to change. Source: MedPAC analysis of FY 2013 MedPAR, IRF-PAI, and Medicare cost report data from CMS.

# Concerns about IRF PPS: Summary

---

- Patient selection and coding behavior may contribute to margin disparities
- More work needed:
  - Targeted adjustment to correct for coding?
  - Differences in profitability across case-mix groups? Will inform discussions of payment reform & rebasing
- Possible short-term fixes:
  - Expand outlier pool to redistribute payments to costly cases
  - Increase program oversight
